Jack Henry Traffic Control™

take command of your digital perimeter

As the digital landscape becomes increasingly complex, highly sophisticated financial institutions require a greater degree of control over their environment. Jack Henry Traffic Control is strategically designed for security-conscious institutions that need to manage their digital traffic with precision.

Bring Your Own Firewall

The complexity of modern cyber security threats requires a tailored defense. Jack Henry Traffic Control allows you to integrate and configure your own Web Application Firewall (WAF) provider directly within the Banno ecosystem.

Precision Control with Custom Blocking Rules

Allow your team to enable and define advanced, custom controls that may be needed to meet your financial institution's unique compliance or risk profile demands. Jack Henry Traffic Control ensures your team is able to define and enforce custom block rules.

Unprecedented Visibility into Traffic Management

Jack Henry Traffic Control introduces a new level of institutional control alongside Banno's platform-level WAF. This shift provides your security team with the highest degree of visibility and control over all login traffic, gaining the autonomy required to manage your financial institution's unique security story.

a more tailored perimeter defense

We are committed to providing your specialized security teams with the tools they need to define exactly who can approach your digital front door. Jack Henry Traffic Control gives your financial institution robust flexibility to front your Banno Online™, Banno Mobile™, and JHA Treasury Management™, instances with your own WAF.

bring your own WAF

A default security posture doesn't always take into account nuanced, specific security needs of individual financial institutions. By bringing your own WAF into the Banno ecosystem, your financial institution gains the ability to leverage the exact security stack and configurations your team has already mastered. This isn't about just adding a layer, it's about seamlessly creating a hardened perimeter that aligns with your internal infrastructure. Cloudflare will be the first provider supported, but others will be supported in the future.

For accountholders, this means a safer environment without sacrificing the speed they expect. You ensure that legitimate traffic is optimized and protected by the same high-standard tools by the world's leading technology companies. Your security personnel will be able to act with confidence, knowing they have full command over the tools protecting your digital perimeter.

Your Server
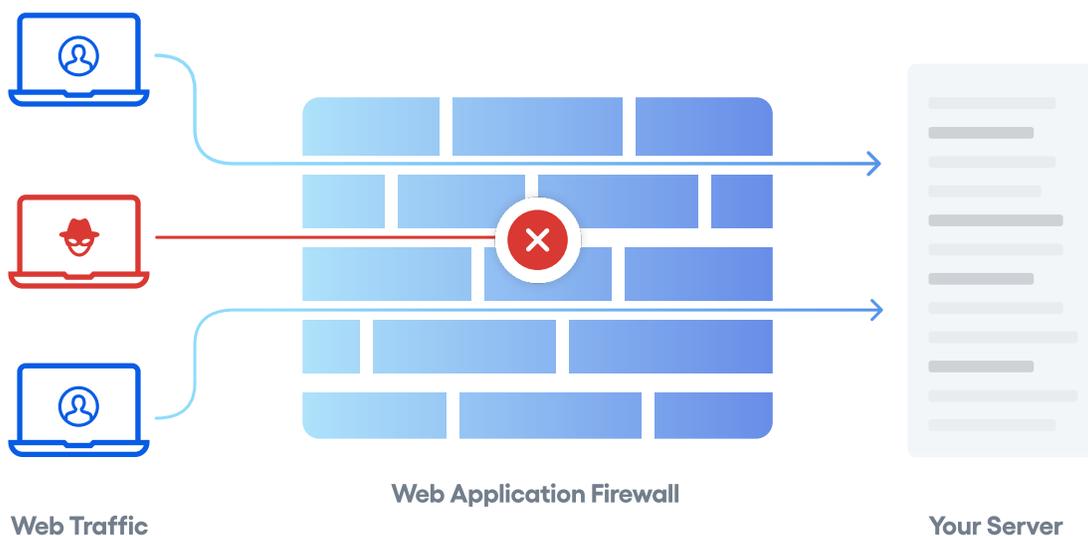

precision control with custom blocking rules

Jack Henry Traffic Control allows your team to enable and define advanced, custom controls that may be needed to meet your financial institution's unique compliance or risk profile demands. Jack Henry Traffic Control ensures your team is able to define and enforce custom blocking rules.

Until now, many blocking rules had to be applied globally. We heard that this was not enough for financial institutions with specialized security teams that required nuance. Traffic Control changes that narrative by empowering you to set granular thresholds based on geographic origin or specific IP locations. Whether you need to comply with strict regional regulations or proactively block known "hot zones" of fraudulent activity, these custom rules provide complete control over your digital front door.

This level of precision directly impacts your accountholders. It gives your financial institution the ability to react to emerging global threats in real-time, tailoring your defense to the specific needs of your institution and its unique footprint.

unprecedented visibility into traffic management

Jack Henry Traffic Control shifts the power of perimeter blocking to your financial institution.

Visibility is the cornerstone of a modern security strategy. Traffic Control provides your specialized security experts with a bird's-eye view of every attempt to access your digital instances. The shift to active management allows your team to move beyond basic protection into a proactive stance. Ultimately, creating a more resilient financial institution through total visibility.
